N123456789

Session Summary & Progress Information

Session Date: 2026-06-20 | Duration: 1.5 hours | Location: Telehealth / Home Visit
Session Type: Initial Intake & Psychosocial Screening

Clinical Note:

Participant engaged well in the initial intake session, presenting with a flat affect and guarded interpersonal style. Participant reported significant difficulties with daily functioning, specifically citing severe anxiety that prevents them from leaving the house to attend community activities or maintain social connections. Participant described a 6-month history of increasing social withdrawal following a period of acute psychological distress. Mental State Examination (MSE) revealed normal speech and thought processes, but noted hypervigilance and poor concentration. Participant is currently not engaged with any other allied health or psychological services. Risk assessment (C-SSRS) indicated no current active suicidal ideation or intent, though passive thoughts of worthlessness were noted. Participant expressed a strong desire to "feel normal again" and agreed to a structured therapeutic approach focusing on anxiety management and gradual community reintegration.

=== ASSESSMENT REPORT: GAD-7 ===

Test: GAD-7 (Generalized Anxiety Disorder)

Resulting Score: 15 / 21

Clinical Judged Severity: Severe Anxiety

Itemised assessment answers:

- Item 1: Feeling nervous, anxious or on edge -> Selected: "Several days" (+1)
- Item 2: Not being able to stop or control worrying -> Selected: "More than half the days" (+2)
- Item 3: Worrying too much about different things -> Selected: "Nearly every day" (+3)
- Item 4: Trouble relaxing -> Selected: "Several days" (+1)
- Item 5: Being so restless that it is hard to sit still -> Selected: "More than half the days" (+2)
- Item 6: Becoming easily annoyed or irritable -> Selected: "Nearly every day" (+3)
- Item 7: Feeling afraid as if something awful might happen -> Selected: "Nearly every day" (+3)

Clinical Interpretation / Plan Objectives:

The GAD-7 score of 15 indicates severe anxiety symptoms that are significantly impacting the participant's psychosocial functioning and capacity to engage in daily living activities. The participant's anxiety manifests primarily as pervasive worry, physical restlessness, and anticipatory fear, which act as substantial barriers to community access and social participation (aligning with NDIS Capacity Building goals).

Plan Objectives for Next Session:

1. Psychoeducation on the physiological and cognitive cycles of anxiety to build participant's self-awareness and emotional

regulation.

2. Introduction to basic grounding techniques (e.g., 5-4-3-2-1 sensory awareness) to manage acute restlessness and anticipatory fear in real-time.
3. Collaborative goal setting to identify one low-demand, highly structured community activity to attempt in the coming week, to be supported by the Psychosocial Recovery Coach.
4. Continue to monitor risk and emotional wellbeing using standardised tools at the next session to track therapeutic progress.
